## FORAGE SUITABILITY GROUP

## Claypan

FSG No.: G054XY800ND

**Major Land Resource Area:** 54 - Rolling Soft Shale Plain

## **Physiographic Features**

These soils are found on uplands, fans, and terraces.

Runoff Class: Negligible Very high

#### **Climatic Features**

This group occurs in a mid-continental climate characterized by wide seasonal temperature and precipitation fluctuations and extremes.

Annual precipitation varies widely from year to year in MLRA 54. Average annual precipitation for all climate stations listed below is about 17 inches. About 78 percent of that occurs during the months of April through September. On average there are about 25 days with greater than .1 inches of precipitation during the same time period.

Average annual snowfall ranges from 23 inches at McLaughlin, SD to 48 inches at Glad Valley, SD. Snow cover at depths greater than 1 inch range from 20 days at Bison, SD to 92 days at Hebron, ND.

Average July temperatures are about 71 degrees F., and average January temperatures are about 13 degrees F. Recorded temperature extremes in the MLRA during the years 1961 to 1990 are a low of -49 degrees at Breien, ND, and a high of 111 recorded at Hettinger, ND. The MLRA lies in USDA Plant Hardiness Zones 3b, 4a, and 4B.

At Bismarck, the closest station with such records, the average morning relative humidity in June is about 84 percent and average afternoon humidity is 55 percent. It is cloudy an average of 165 days a year.

The climate data listed in the tables below represent high and low ranges and averages for the climate stations and dates listed. For additional climate data access the National Water and Climate Center at <a href="http://www.wcc.nrcs.usda.gov">http://www.wcc.nrcs.usda.gov</a>.

# **Soil Interpretations**

This group consists of moderately well and well drained, moderately coarse to moderately fine textured soils formed from alluvium and residuum. They have claypan subsoils with slow permeability. The underlying material and lower part of the subsoil typically have high amounts of soluble salts and are alkaline.

**Drainage Class:** Moderately well drained To Well drained

Permeability Class: Very slow To Slow (0 - 40 inches)

Frost Action Class: Low

	<b>Minimum</b>	<u>Maximum</u>
Depth:	72	
Surface Fragments >3" (% Cover):	0	3
Organic Matter (percent):	1.0	6.0
Electrical Conductivity (mmhos/cm): (0 - 24 inches)	8	16
Sodium Absorption Ratio: (0 - 12 inches)	0	25
Soil Reaction (1:1) Water (pH): (0 - 12 inches)	5.1	8.4
Available Water Capacity (inches): (0 - 60 inches)	2	8
Calcium Carbonate Equivalent (percent): (0 - 12 inches)	0	20

# **Adapted Species List**

The following forage species are considered adapted to grow on the soils in this group. Additional information concerning plant characteristics of a number of the listed species, as well as individual cultivars of many of those species, can be accessed at <a href="http://plants.usda.gov/">http://plants.usda.gov/</a>

Cool Season Grasses	<b>Symbol</b>	<b>Adapted</b>	Warm Season Grasses	Symbol	<b>Adapted</b>
Beardless wildrye	LETR5	F	Blue grama	BOGR2	F
Crested wheatgrass	AGCR	F	<u>Legumes</u>		
Dahurian wildrye	ELDA3	F	Alfalfa	MESA	F
Newhy hybrid wheatgrass		F	Hairy Vetch	VIVI	F
Tall wheatgrass	THIN6	F	Sweetclover	MELIL	F
Russian wildrye	PSJU3	F			
Slender wheatgrass	ELTR7	G			
Western wheatgrass	PASM	G			

G - Good adaptation for forage production on this group of soils in this MLRA

F - Fair adaptation but will not produce at its highest potential

#### **Production Estimates**

Production estimates listed here should only be used for making general management recommendations. On site production information should always be used for making detailed planning and management recommendations.

The high forage production estimates listed below are based on dense, vigorous stands of climatically adapted, superior performing cultivars. They are properly fertilized for high yields, and pest infestations are kept below economic thresholds. Mechanical harvests are managed to maintain stand life by cutting at appropriate stages of maturity and harvest intervals. If grazed, optimum beginning and ending grazing heights are adhered to. Adequate time is allowed for plant recovery before entering winter dormancy under both uses.

The production estimates listed below represent total annual above ground plant production on an air-dry-matter basis. Estimates of hay and grazing yields can be calculated from these numbers by multiplying them by a harvest efficiency. A 70 percent harvest efficiency is commonly used when converting to hay yields. Pasture harvest efficiency is highly dependent on the grazing management system applied, ranging from 25 to 50 percent.

Forage Crop	Management Intensit				
	High	Low			
	(lbs/ac)	(lbs/ac)			
Alfalfa	4200	1900			
Alfalfa/Crested wheatgrass	3000	1500			
Alfalfa/Intermediate wheatgrass	3500	1600			
Alfalfa/Pubescent wheatgrass	3500	1600			
Crested wheatgrass	3000	1400			
Intermediate wheatgrass	3200	1400			
Pubescent wheatgrass	3200	1400			
Western wheatgrass	2200	1000			

## **Forage Growth Curves**

Growth curves estimate the seasonal distribution of growth of the various forage crops. They indicate when the forages may be available for grazing or mechanical harvest.

#### **Soil Limitations**

These soils have severe limitations to the production of climatically adapted forage species. The claypan and the soluble salts and sodicity in the subsoil produce an unfavorable rooting environment, limiting species selection and production potential.

## **Management Interpretations**

The impact on yields can be reduced by selecting forage species that are tolerant of salinity and sodicity and can root in dense, clayey subsoils.

Pasture and hayland can include considerations for wildlife. Delaying grazing on portions of the pasture or rotating pastures will allow nest initiation of grassland nesting birds or species of concern. Nest initiation of most grassland nesting birds occurs from April 15 to June 1. Delaying haying until after July 15 allows for most species to fledge their young. Consider planting species with later maturity to allow for harvesting after nests have fledged. Avoid mowing around the field. Mow back and forth or from the inside to the outside of the field. Consider using flushing bars on swathers and mowers.
